

# Lab 7

---

Andrew Hopkins CM: 1164

1. Selenium would allow you to test your site very quickly without having to enter all the necessary information yourself, and check to make sure it is there.
2. Selenium only checks to make sure your content is there, not how it looks, so if you rely only on selenium you might end up with a bad looking site.
3. `<tr><td><a href="myCase.html">MyCase</a></td></tr>`
4. `<tr>  
    <td>click</td>  
    <td>//a[@id='myLink']/</td>  
    <td></td>  
</tr>`
5. You can inspect your test cases graphically by opening the test case in your browser and inspecting the table. One possible drawback is that you have to write a lot of extra code for the html to work properly, you can't just write `click(param 1, param2)`.
